<https://rivoluzione-unoeditori-com.translate.google.it/mercato-dei-bambini-mai-nati-big-pharma-vaccini-e-il-traffico-dei-feti-abortiti/> which you used to be able to translate into English via Google translate, but now is only in Italian as of 1/25/2022. Google would like to rewrite history. It's fact checkers are really fact redactors, so be sure to take screenshots and download information when you find it, so they have plenty of egg on their face in 2022. **That is how we will end CENSORSHIP.**

It is called kinky and is the latest trend in the United States: conceiving a child to have an abortion. A young man, interviewed by the Associated Press, serenely recounted his life experience:

**"My girlfriend loves to get pregnant and she likes to have an abortion. She does not menstruate and is therefore very sexually active. In the last ten years we have had SEVEN abortions."**

It is not a horror film but reality, and often happens, surpasses any fantasy, sometimes even those of Orwellian memory. But that's not all.

The fetuses thus generated and then aborted are usually used as spare parts and normally born in the **twentieth week of pregnancy**. Subsequently, **already formed organs**, in particular the liver, will be taken from them.

American family counseling centers, such as the Planned Parenthood Institute, first help women terminate pregnancy. And immediately afterwards with the doors half closed, a very profitable journey begins. **The aborted fetus is dissected into different parts, liver, kidney, thymus, skin, which are SOLD.** A liver can cost up to \$350. In a video shot inside Planned Parenthood by the pro-life Center for Medical Progress, the price list of the Da Vinci Biosciences company, a fetal tissue brokerage firm, also appears; \$750 for the brain of a fetus, \$500 for the lymphatic glands, \$350 for a kidney.

The market is profitable and Dr. Jorg C. Gerlach, an experimental surgeon at the University of Pittsburgh, has developed a dedicated technique to harvest uncontaminated livers from LIVE BIRTHS following late abortion.

**Gerlach's so called protocol for liver harvesting is used for experimental stem cell transplants according to the "Current Good Manufacturing Practice" or CGMP guidelines developed by the HHS. According to medical publications VIVISECTION procedures generally take place at the University of Pittsburgh and are funded by the NIH with a whopping \$2 million since 2011.**
